

water softener filters-Waterhoh water softener filters

A water softener filters is an appliance designed to remove minerals from water by means of an ion-exchange process. As water flows through a bed of sodium-impregnated resin beads, mineral ions are drawn from the water to the beads. The sodium ions are added to the water. The water softener unit recharges the beads with brine or a potassium chloride solution. Some water softeners have separate tanks for the sodium resin and the brine while others have the resin tank inside the brine tank.

Full-home water softener filters typically are installed right where the main water line enters the house. For economy, some systems bypass faucets and fixtures that don't need soft water, such as toilets and exterior water systems. Depending on what system you have and who owns it (you or a leasing company), your water softening system may be maintained by a service company. All you need to do to get soft water is turn on the tap and pay the bill.
